

MIDFOOT ARTHRODESIS POST-OPERATIVE GUIDELINES

INITIAL SURGICAL DRESSING

A gauze dressing will be covered by a very padded cast. This cast is too wide to accommodate a rubber walking boot. Caution is used to avoid sliding when the cast is resting on a hard floor surface. Occasionally, the cast needs to be decompressed if the pain control is not gained by 36 to 48 hours postoperative.

BED REST, ELEVATION, AND WEIGHTBEARING

Bed rest is prescribed for at least three days after operation. During the period of bed rest, the feet are elevated above the level of the heart. After the period of bed rest, progress with sitting with the feet elevated at chair level. Progressing with ambulation around the house is encouraged. Confinement to the house for the first week is recommended.

No weightbearing is allowed for at least two months after operation. Usually slow and deliberate progression in weightbearing is made at 25% increments after the first two months. Full weightbearing is approached about 11 weeks after the operation.

CRUTCHES/WALKER/CANE

Crutches are used for almost three months. As the third month approaches and almost full weightbearing is gained, transition to a cane is made. Initially, the cane is used on the side of the operated foot if one foot is operated upon. As comfort improves, walking is done more smoothly with a cane when the cane is in the opposite hand.

BANDAGES, CASTS, AND WALKER BOOTS.

The initial cast is changed to a second cast at two weeks postoperative. The second cast is changed and x-rays are taken at two months postoperative. After two months, the cast is a weightbearing one. At three to four months, conversion is made to a removable walker boot.

FOOTWEAR AND ELASTIC STOCKINGS

At about four months postoperative, transition to a shoe is made. A lightweight hiking boot is often ideal. An elastic stocking is used at the time the walker boot is provided. The elastic stocking is used for approximately four months.

SHOWERING, SUTURES, AND DRIVING

The cast should be kept dry. This can be done with double trash bags bound tightly at the knee with a strong rubber band. Commercially available “cast guards” are available through the internet. Search on Google using the term Cast Guard. The showering cast guards are also available at some orthopaedic supply stores.

Sutures are removed at two weeks postoperative.

For right foot arthrodesis surgery, driving is usually started 14 to 16 weeks postoperatively, when safe. If the left foot is the operative one, driving may be started two to three weeks postoperative. Earlier driving may cause increased swelling in the right foot as it is in a dependent position.

REHABILITATIVE EXERCISES

First week: Isometric exercises are begun on the day of surgery as soon as able. Tighten (contract) the muscles of the foot and leg for 20 seconds, relax briefly and repeat. A “set” of isometric contractions is 5. Make an effort to do one set of isometric contractions every two hours of the waking day until ambulating with full weightbearing and without a cast.

Massage is started when a removable walker boot is used. Use both hands to grasp the ankle and the foot (including the toes). Apply progressively greater pressure with the hands. A set of massage is 5 twenty-second (hand applications). Do 4 or 5 sets per day in the initial two weeks of massage, then reduce the massage sets as motion exercises become emphasized.

Formal physical therapy is prescribed beginning with the time that a removable device is used. The physical therapy will emphasize maximizing residual motion, strengthening the lower extremity, and in the later phases of physical therapy, emphasis will be placed on developing maximum smoothness of walking (gait).

SKIN CARE

Skin care is to begin when a removable device is used. At that time, soften the skin with Vaseline, vitamin E ointment, or a thick hand lotion like Curel. When using Vaseline, cover the whole foot with a light amount of Vaseline and wipe away any excess. Do 2 or 3 times a day.
